

Iridescent Octahedral Galena Xls.

This is a very cool piece. The iridescence takes place on the defined octahedral crystals, but on the base, where the contact was, it is the usual bright, metallic color most often associated with Galena.

Description

This is a very cool piece. The iridescence takes place on the defined octahedral crystals, but on the base, where the contact was, it is the usual bright, metallic color most often associated with Galena. Only some contact damage on the bottom, but otherwise a very interesting specimen.

Location: Ozark Lead Mine, 13 miles NW of Ellington, Viburnum Trend Dist., Reynolds Co., Missouri
